Developmental Testbed Center

Motivation and Overview

- Assess forecast performance of Noah-MP within WRF-ARW for the Air Force Weather Agency (AFWA)
- Noah-MP: *Improvement upon Noah with more physical representation of biophysical and hydrological processes* with multiple options to parameterize:
 - Vegetation canopy layer
 - Modified two-stream radiation transfer scheme
 - Ball-Berry type stomatal resistance scheme
 - Short-term dynamic vegetation model
 - Simple groundwater model with runoff scheme
 - Physically-based three-layer snow model
 - Frozen soil scheme that produces greater soil permeability
- Test two configurations with the same namelist options with exception to the LSM (**Noah / Noah-MP**)

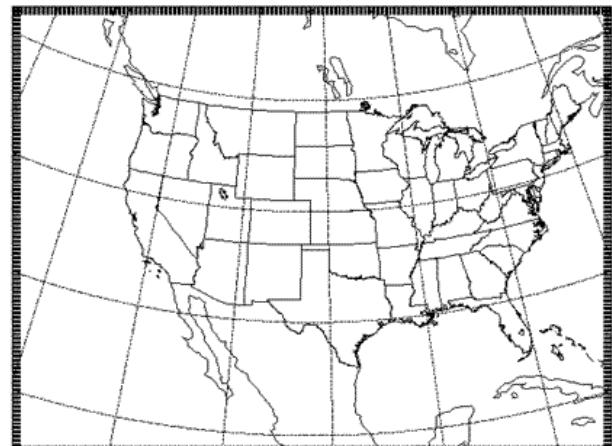

Physics Suite	Configuration
Microphysics	WSM5
Radiation (LW/SW)	RRTM/Dudhia
Surface Layer	Monin-Obukhov Similarity Theory
Land Surface	Noah/Noah-MP
PBL	YSU
Convection	Kain-Fritsch

```
&noah_mp  
dveg = 4,  
opt_crs = 1,  
opt_sfc = 1,  
*opt_btr = 2,  
*opt_run = 3,  
opt_frz = 1,  
opt_inf = 1,  
opt_rad = 3,  
opt_alb = 2,  
opt_snf = 1,  
opt_tbott = 2,  
opt_stc = 1,  
/  
* Non-default option
```

Experiment and Evaluation

- **End-to-end system:** WPS, WRFDA, WRF-ARW, UPP, and MET
- **Test period:** July 2011 – June 2012, w/ 48-h warm start simulations initialized every 36 h (244 total cases)
- **Domain:** 15 km CONUS grid w/ 56 vertical levels and model top of 10 hPa
- **Evaluation:**
 - Surface and upper air [(BC)RMSE, bias] – temperature, dew point temperature, wind speed
 - Precipitation [Gilbert skill score, frequency bias] – 3- and 24-h accumulations
 - GO Index - weighted RMSE across variables, domain, and lead time
 - Statistical Assessment
 - Confidence Intervals (CI) at the 99% level
 - Statistical Significance (SS) and practical significance (PS)
 - Accumulated stats over domain - soil temperature, soil wetness, and snow variables
 - Verification by observation station - temperature, dew point temperature, and wind speed bias

Season	Date Range
Summer	July – Sept. 2011
Fall	Oct. – Dec. 2011
Winter	Jan. – March 2012
Spring	April – June 2012

Summary and Next Steps

- Performed extensive T&E on two WRF configurations in order to assess the performance of Noah-MP
 - Generally, a cold temperature bias for both configurations
 - Performance differs spatially and temporally:
 - During the summer, in the central CONUS and desert SW, Noah-MP has significantly higher dew point biases (better performer is dependent on forecast hour)
 - In the Midwest during winter, Noah-MP has significantly cooler temperature biases at times valid from 03 – 15 UTC (AFWAOC typically closer to observations)
- Areas of further investigation:
 - Differences in soil moisture (w/ emphasis on winter season)
 - Differences in snow water equivalent/snow depth/melting
 - Water/moisture budgets → where is it going?
 - Areas of high dew point temperature biases for Noah-MP in the summer
